A scoping review of literature in multilingual assessment in higher education

Marella Tiongson[a], Sanne Larsen[a], Joyce Kling[b] and Slobodanka Dimova[a]

[a]Centre for Internationalisation and Parallel Language Use, University of Copenhagen, Copenhagen, Denmark; [b]Centre for Languages and Literature, Lund University, Lund, Sweden

ABSTRACT
Recent research regarding internationalized higher education has recognized that although English is commonly used as the medium of instruction, students and teachers are highly multilingual. While there have been calls to transcend the limitations of being English-centric, the need to reconceptualize assessment practices to cater to the needs of multilingual learners has received much less attention. This scoping review synthesizes 28 existing theoretical and empirical studies on multilingual assessment in higher education, identifying the focus areas of the literature. Findings were categorized into the following themes: (1) bibliometric characteristics of the included studies (2) theoretical underpinnings; (3) operationalizations of the theoretical models of multilingualism in the included studies; and (4) the advantages and disadvantages of multilingual assessment and stakeholder perspectives. The review also identifies areas that have been under-researched, highlighting the need for future research to develop more multilingual assessments that evaluate content knowledge, consider more multilingual contexts and languages outside of English, and bridge the gap between research on multilingual assessment that has been conducted in primary and secondary schools and higher education.

ARTICLE HISTORY

KEYWORDS
Scoping review; multilingual assessment; multilingual communicative competence; internationalized higher education

Introduction

In the past decades, an increasing number of higher education institutions have implemented English as a medium of instruction (EMI) to attract students, increase lecturer mobility, and facilitate access to the most recent international research, which tends to be published in English. Therefore, much emphasis has fallen on students' and lecturers' levels of English proficiency, as well as their coping mechanisms in relation to teaching and learning in a foreign language (L2). Hence, research on assessment in EMI university settings has focused on measuring students' and lecturers' English proficiency and/or students' performances on disciplinary exams (Dimova and Kling 2022). While English proficiency assessment has been implemented to identify students and lecturers who lack threshold proficiency levels in English for academic demands, students' exam performances have been analyzed to understand to what degree L2 English affects students' ability to display their disciplinary (content) knowledge (Dimova 2020; Iliovits, Harding, and Pill 2022).

More recently, theoretical discussions regarding internationalized higher education have acknowledged the fact that although there is a widespread use of English, sometimes as the sole

medium of instruction, internationalized university contexts are highly multilingual (Dafouz and Smit 2020; Kuteeva, Kaufhold, and Hynninen 2020). In such multilingual settings, research has described how students and lecturers strategically use their rich communicative repertoires, which comprise multiple linguistic and semiotic resources, to deal with complex content material as part of their learning process, as well as during examination (Kuteeva 2023). Research on such contexts has focused on describing teachers' multilingual pedagogy and students' multilingual practices, but when it comes to assessment, examinations usually involve the use of only one language. Not only do these findings call for the need to transcend the limitations of English-centrism, but they also point to the need to reconceptualize assessment practices and take a critical perspective on monolingual assessment policies.

While multilingual pedagogy has gained traction in educational curricular development, multilingual approaches remain largely absent in content and language assessment even in EMI contexts (Schissel et al. 2018). There is a growing body of research arguing for multilingual assessments, because allowing multilingual students to use the languages they are proficient in helps them communicate content knowledge, minimizes linguistic bias, and improves educational outcomes (Wright and Li 2008). Some scholars claim that multilingual assessment thus shows greater construct validity and authentic representation (Shohamy 2011) and promotes equity by recognizing diverse linguistic repertoires (Heugh, Li, and Song 2017). Consequently, an increasing number of teachers have also shown openness and support for multilingual assessments (Schissel, Leung, and Chalhoub-Deville 2019). Nevertheless, theoretical and empirical literature on multilingual assessment in higher education remains sporadic and scattered, which poses challenges to the consolidation of the multilingual communicative competence construct in the domain of higher education and the operationalization of the construct in multilingual assessment practices.

The uneven trajectory of literature on multilingual assessment and the use of varied terminology and definitions contribute to the vagueness of the construct of multilingual communicative competence and hinder possibilities for establishment of reliable multilingual assessment practices. In some sources, the terms multilingualism and plurilingualism are used interchangeably, while in others, a clear distinction is made between them – plurilingualism refers to the holistic and integrated linguistic repertoire of an individual or, more rarely, a society, whereas multilingualism refers to the occurrence of multiple languages that coexist in a particular social group or the society as a whole (Mouti 2024; Piccardo and North 2020). When it comes to display and operationalization of multilingualism/plurilingualism in communication, the concepts of code-switching and translanguaging transpire in the sources (Chalhoub-Deville 2019; Cumming 2013; Gorter and Cenoz 2017; Martín-Peris, López-Ferrero, and Bach 2018). The terms translanguaging (García 2009) and translingual practices (Canagarajah 2012) are the prevalent concepts though because they represent the holistic perspective on language users' communicative repertoire, a perspective most sources on multilingual assessment have adopted. Such variation in terminology also results in variations in multilingual assessment. These conceptual ambiguities all point to the need to conduct a review of the state of multilingual assessment in higher education.

To our knowledge, this scoping review is the first conducted on multilingual assessment in higher education. It sets out to find what types of multilingual assessments have been conducted in the higher education context in general, because we are interested in seeing what research exists in the literature without only restricting the context to EMI in higher education. Although the purpose of the scoping review is to inform multilingual assessment in the context of non-English-dominant EMI, the contexts included in the scoping review are defined more broadly. Such an approach would allow us to identify existing literature that could have relevance for the development of a research agenda in EMI.

This review aims not only to give an overview of what has been theorized and researched in this field, but also to identify areas for future research. The scoping review is guided by the following questions:

1. What are the bibliometric characteristics of published research on multilingual assessment in higher education in general?
2. What are the theoretical underpinnings of multilingual assessments in these studies?
3. How is students' multilingual competence operationalized and measured?
4. What are the key findings of previous studies on the advantages and disadvantages of multilingual assessment methods? What are stakeholders' perspectives on multilingual assessment?

Methodology

This paper uses a scoping review approach (Arksey and O'Malley 2005) to examine the literature. A scoping review is a type of literature review with a broad range that maps the existing literature on a particular topic. It also identifies key concepts and gaps in the literature and establishes the relevance of the research area, especially if the topic is complex or has not yet been comprehensively investigated. When conducting the review, the stages of the scoping review methodology were followed: (1) identifying the research question, (2) identifying relevant studies, (3) study selection, (4) charting the data, and (5) collating, summarizing, and reporting the results.

Literature search strategy

The literature search did not have a set time frame or year, so that the entire period where multilingual assessment first appears, and its current applications could be accounted for. Given that some of the databases in the initial search (e.g. Linguistics and Language Behavior Abstracts (LLBA), PsycINFO, JSTOR) yielded many sources from irrelevant fields like medicine or speech pathology, we limited our study to the following databases: Education Resources Information Center (ERIC), Web of Science, and Scopus. We conducted the literature search for the study in October 2024 initially and repeated it in December 2024 to see if any new publications had come out, using the following search terms: (multiling* OR pluriling* OR translang*) AND assessment AND ('higher education' or 'university' or 'tertiary education'). Because of the similar and almost synonymous uses of the terms 'multilingualism,' 'plurilingualism,' and 'translanguaging,' they were all included and grouped as one search term using the Boolean operator OR. This was the same for 'higher education,' 'university,' and 'tertiary education.' The search yielded the following hits: ERIC (97), Web of Science (509), and Scopus (279). We also applied a snowball citation search strategy by going through the reference list of articles to identify other relevant studies (7).

Inclusion and exclusion criteria and study selection process

This review made use of the PRISMA-ScR 2020 flow diagram to guide the search and retrieval process of the articles. The phases include (1) identifying the articles, (2) screening articles, (3) assessing them for eligibility, and (4) including relevant ones in the review. The process of article selection was iterative, with the researchers meeting regularly to clarify any uncertainty that came up during the study selection.

Several inclusion and exclusion criteria, based on the research questions, guided the selection of the studies. All studies had to meet four inclusion criteria before being included. First, we only included articles published in English, because this was the common language of all the researchers, and most international peer-reviewed articles tend to be published in English. Second, we included only research on multilingual/plurilingual/translingual assessment published in peer-reviewed journals and book chapters, to ensure the quality and rigor of the studies. Third, for the empirical studies, we included only those that focused on multilingual assessment of content and/or language in higher education. Fourth, for the conceptual/theoretical papers, we originally screened the papers for focus on multilingual assessment frameworks in higher education. Later, we extended this

criterion to include papers from secondary school and immigrant education contexts, given the paucity of publications in the higher education context. These conceptual papers provide us with a model of the multilingual construct that could be applied to higher education.

Meanwhile, we excluded articles based on the following criteria: (1) empirical studies conducted in early childhood, primary, or secondary settings; (2) articles that focused on assessing the quality or effectiveness of programs or policies; (3) articles that focused primarily on pedagogy where assessment was only mentioned in passing, but not explored in depth; (4) articles that focused only on assessing language and/or content in only one language; (5) studies that focused on multilingual students only, but did not implement multilingual assessment; (6) articles that focused only on social justice or the dominance of certain languages over others; (7) book reviews or conference proceedings; and (8) studies with incomplete information (i.e. abstracts were incomplete or full text could not be accessed).

There are notably many exclusion criteria because the term 'multilingual assessment' is broad in scope and brought out a variety of results that were not relevant to our review. The decision to only focus on multilingual assessment in higher education aligns with the gaps identified in the introduction and the scope of this study. Moreover, we decided to focus on multilingual assessment in higher education in general, and not specifically on EMI higher education, because while we see EMI in internationalized universities as multilingual contexts, we expected to identify only a very limited number of studies from EMI contexts, given that the focus in these contexts has been primarily on English.

We used Covidence, a systematic review tool, to conduct the scoping review and manage references. Title and abstract screening was done by the first author, while selecting which studies went through full text inclusion was done by all four authors through blind reviewing and skimming the texts. We also had discussions when there were differences in our selection results, which helped us refine our criteria and definitively decide which studies to include. We had a high level of agreement (80%), based on data from Covidence. A total of 28 studies were included (see Figure 1 for the PRISMA chart illustrating the literature search and selection process for this review).

Data analysis and extraction

Once this stage was finalized, the data collected was descriptively summarized using an extraction template on Covidence that we customized to fit the aims of the study. The information extracted included author details, publication year, country of origin, research questions and goals, research design, data collection methods, sample population, and key findings. The articles further underwent a deductive thematic analysis as part of the extraction, with a set of a priori identified themes. At least two of the four researchers read the 28 studies included in full to extract data. Two authors out of the four were needed to independently extract the data from the articles included, and the first author completed the consensus on them. In cases of differences in the data extracted, these were clarified and discussed to reach consensus. Because the nature of data analysis in scoping reviews is more descriptive and narrative than in systematic and meta-analyses (Arksey and O'Malley 2005), the data analysis included a summary of the studies and descriptive measures (i.e. frequency counts and percentages). Microsoft Excel was used for this purpose, using the extracted data from Covidence.

Results

The following is a synthesis of the themes identified in the studies collected and coded in this review. We start by providing an overview of the bibliometric characteristics of the sources collected and coded in this review. This is followed by addressing theoretical and empirical findings related to multilingual assessment, as well as perceptions of its advantages and disadvantages. The findings of the 28 studies included in this review are summarized specifically in the Appendix.

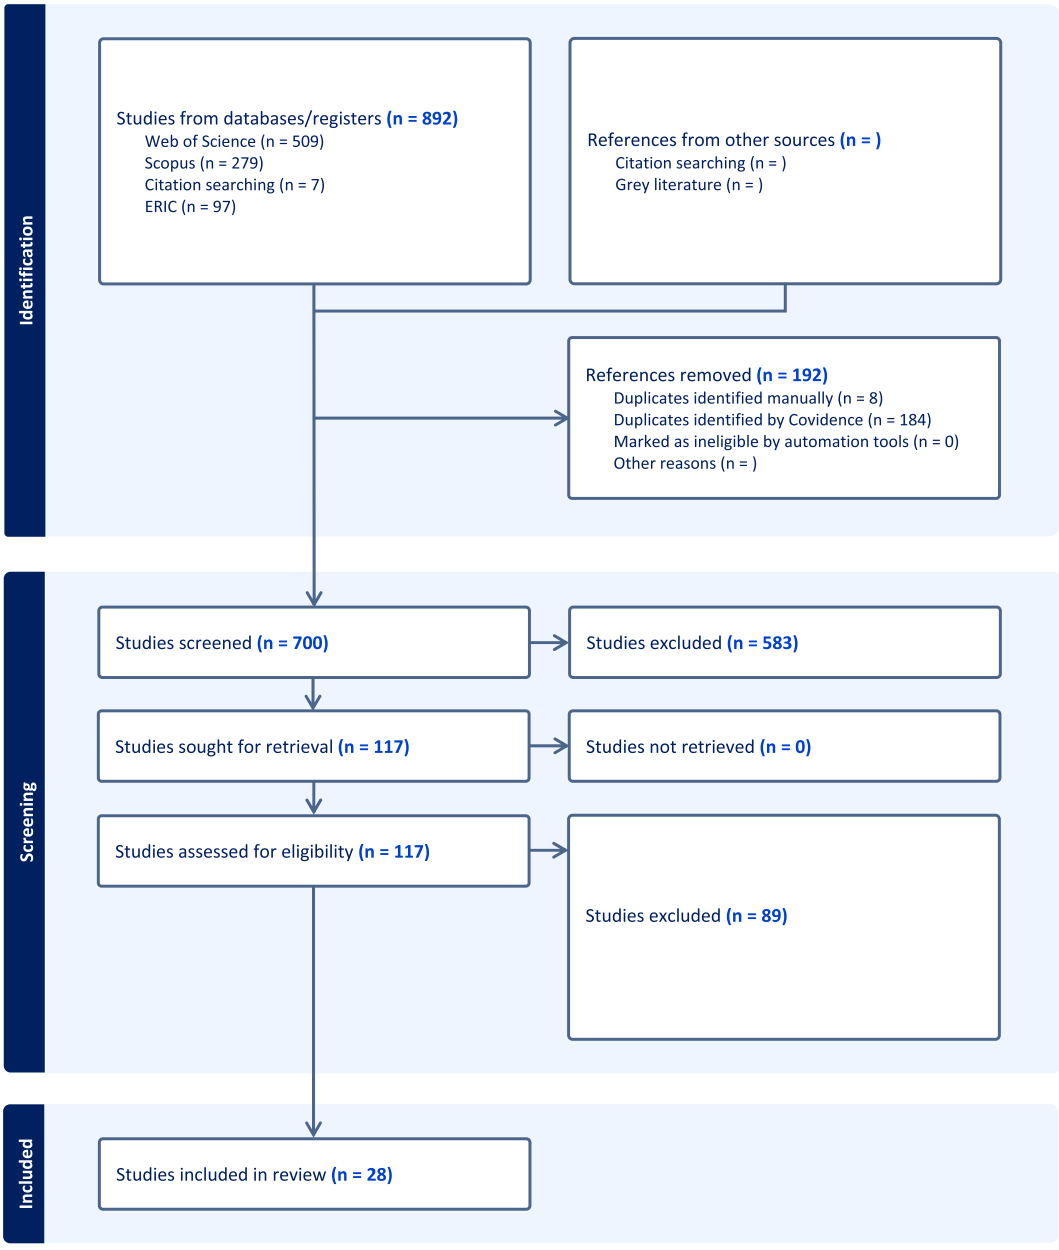

Figure 1. PRISMA flow diagram for selecting articles.

RQ 1: What are the bibliometric characteristics of published research on multilingual assessment in higher education in general?

This section provides an overview of the bibliometric characteristics of the included studies, identifying the areas of research/research domains where multilingual assessment in higher education takes place by looking at which journals these articles have been published in. It also takes stock of the types of research methods applied and considers the balance between conceptual/theoretical studies and empirical studies that operationalize these.

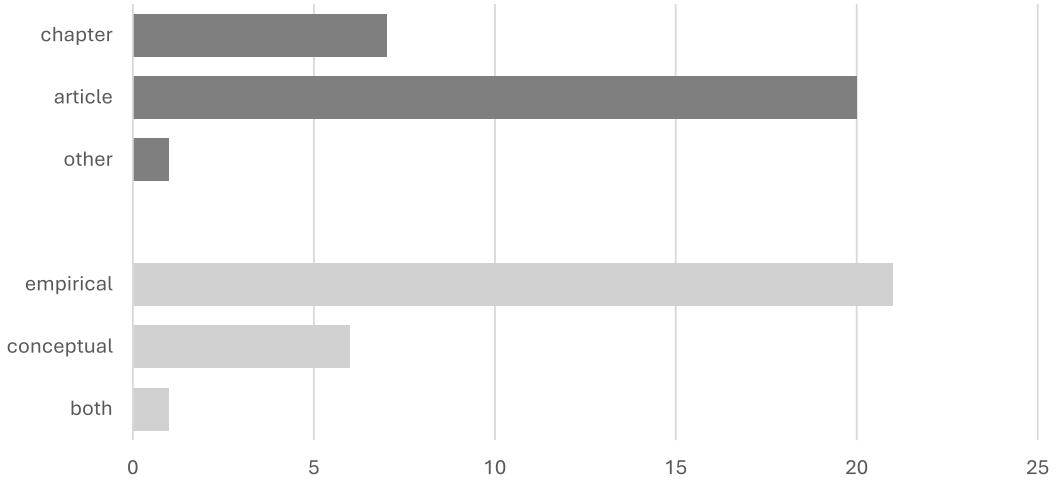

Figure 2. Type of publication and nature of source.

The reviewed sources are predominantly articles (71%) and chapters in edited volumes (25%). In addition, we included one edited volume as one source, rather than considering each chapter as a separate source, because of the overlapping approaches to multilingual assessment across the book chapters (see Figure 2). The articles are published across a range of academic journals that focus on language acquisition and learning. Only two articles are published in a journal focusing on language assessment, i.e. *Journal of Language Assessment Quarterly* (see Table 1).

Most of the publications report on empirical studies (75%), while the rest are conceptual papers that attempt to define the construct of multilingual assessment, and one included both a theoretical perspective and an empirical example. The empirical papers focus on multilingual assessment primarily in higher education, whereas the conceptual papers take a broader perspective when they theorize the construct of multilingualism and its operationalization.

The reviewed sources draw on different concepts to provide a theoretical foundation for multilingual assessment. The most common theoretical concept applied in both conceptual and empirical sources was translanguaging (43%), followed by multilingualism (39%) (see Figure 3). The concept of plurilingualism occurred only in five sources (18%), mostly those relying on constructs

and descriptors proposed by CEFR (Council of Europe 2020). Most reviewed sources focused on multilingual assessment of language proficiency (57%), while multilingual approaches to assessment of disciplinary content (29%) and integration of language and content (29%) were explored less frequently (see Figure 3).

As most empirical studies presented in the reviewed sources focus on classroom assessment practices, they employ classroom-based (48%), action research-based (29%), or observational (9%) methodological approaches. These methodologies are often combined with interviews (14%) or surveys (24%) with the purpose of gauging participants' perceptions on assessment procedures. Only two studies focus explicitly on test or scale validation (see Figure 4). Most studies apply tests or other less formal assessment instruments (76%) (e.g. classroom writing tasks, self-assessment) to elicit relevant data, followed by audio/video recordings (28%), questionnaires (28%), and interviews (28%) (see Figure 4).

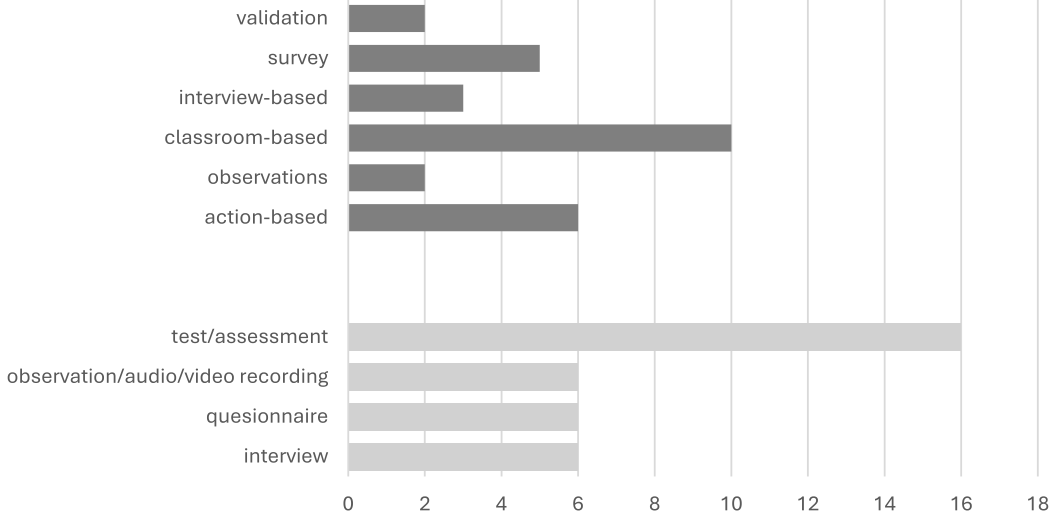

Figure 4. Study design and instruments.

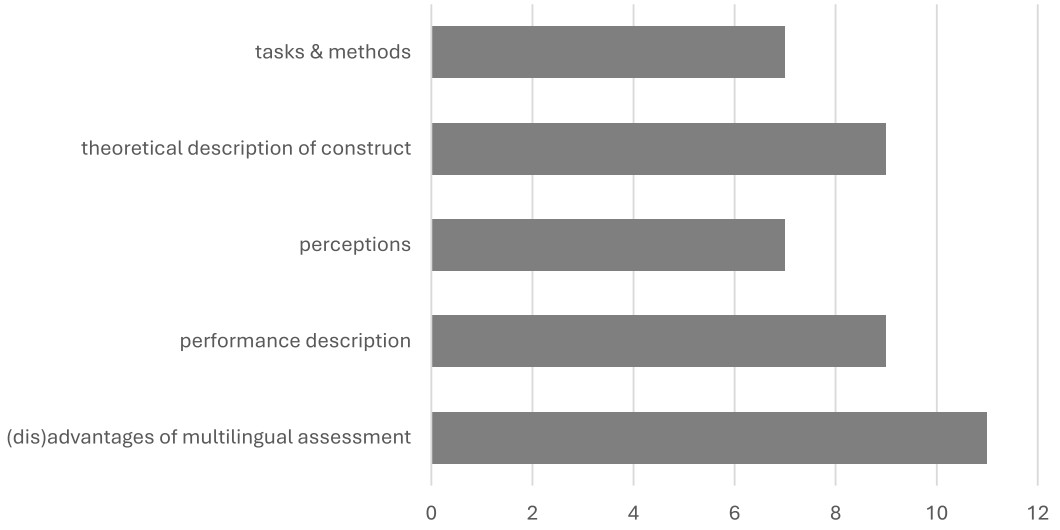

Figure 5. Emerging themes.

The five main thematic codes we used were: (1) tasks and methods, (2) theoretical descriptions of the construct, (3) perceptions, (4) performance descriptions, and (5) (dis)advantages of multilingual assessment (see Figure 5). Many sources were assigned more than one code because they focused on two or more themes. For instance, articles that focused on students' perceptions of a multilingual assessment method also tended to include a discussion on the advantages and disadvantages of the method. Therefore, based on our analysis, (dis)advantages of multilingual assessment was the most common theme (39%), and then theoretical descriptions of the construct (32%) and performance description (32%) was the second most common theme, followed by tasks and methods (29%) and perceptions (29%).

RQ 2: What are the theoretical underpinnings of multilingual assessments in these studies?

One of the reasons for the lack of multilingual approaches in assessment, especially when content and language are integrated, is the paucity of well-established theoretical constructs of multilingual communicative competence. Therefore, it is reasonable to identify existing theoretical models and descriptions of multilingual competence in higher education based on empirical study findings.

We identified nine sources that provided theoretical or conceptual frameworks of multilingual competence that have been used for understanding the underlying constructs in multilingual assessment. Most of these sources argue that the traditional, monoglossic perspectives on multilingualism fail to represent the characteristics of multilingual communication (Chalhoub-Deville 2019; Lopez, Turkan, and Guzman-Orth 2017; Shohamy 2011).

To present the traditional, monoglossic perspective on multilingualism, the sources refer to Grosjean's Language Mode Model (1982, 1985), which relies on the assumption that the languages within the linguistic repertoire of multilinguals are separate systems (Lopez, Turkan, and Guzman-Orth 2017). This means that languages are viewed as complementary rather than integrated. According to this model, the communicative contexts dictate which languages are activated or deactivated, neglecting the possibility of simultaneous activation and use of more than one language. Given the complementary view on languages in the multilingual repertoire, assessment of multilingual competence is based on test takers' performance on monolingual tasks in one or more language, governed by monolingual norms and idealized native speaker characteristics. Scoring rubrics are also monolingual and are designed to penalize translanguaging or code-switching,

which are viewed as L1 interference in test takers' development of interlanguage (Chalhoub-Deville 2019; Lopez, Turkan, and Guzman-Orth 2017; Shohamy 2011).

The more recent conceptualizations of multilingual competence presented in the reviewed sources adopt a holistic perspective, in which the languages in one's linguistic repertoire are integrated, interdependent, and fluid (Bot, Paradis, and Schwieter 2019; Chalhoub-Deville 2019; Lopez, Turkan, and Guzman-Orth 2017). Bot, Paradis, and Schwieter (2019) and Gorter and Cenoz (2017) refer to Cook's Multicompetence Model (2016) as an example of a holistic approach to multilingual competence. This model draws on the premises that multicompetence (1) involves all languages that exist in one's mind and their interrelationships, (2) is not related to monolingual norms, and (3) includes not only all languages but also all cognitive systems one possesses. In other words, with this model, the concept of linguistic deficiency and the need for parallel and equal competence in all languages is rejected (Gorter and Cenoz 2017). Larsen-Freeman's Complex Dynamic Systems Model (2020) builds on Cook's theory in that languages in one's linguistic repertoire are not viewed in isolation, but as embedded within the broader cognitive abilities of the individual. According to this model, language development is part of a complex and dynamic process, and therefore, language learning and use are inseparable (see Bot, Paradis, and Schwieter 2019).

One source (Cumming 2013) highlights the integral role of holistic linguistic repertoires in literacy development. Employment of multiple languages during completion of literacy tasks represents a natural cognitive process, which cannot, and should not, be controlled by educational policies. In fact, Cumming claims that language switching as an effective strategy skilled writers apply to determine the relevance and accuracy of their texts. Strategic use of multiple languages as resources allows for expression of personal identity and voice, as well as identification of clear literacy development goals.

The new theoretical paradigms of multilingualism referred to in the sources emphasize the social context, where language ideologies and communicative strategies, rather than proficiency in a singular language, are in focus (Block 2003; Lafford 2007). Multilingual speakers constantly negotiate the relationship between all languages and activate all their linguistic resources to address their communicative needs. In recent decades, these new paradigms have embraced emerging concepts, such as translanguaging (Garcia, 2009) and translingual practices (Canagarajah 2012). Although these concepts have been widely adopted in theoretical discussions in applied linguistics, their implementation in language assessment has been slow.

In addition to multilingual competence, plurilingual competence is another term used in the reviewed literature that refers to individuals' multiple languages (Mouti 2024). The term plurilingual competence comes from the Common European Framework of Reference (CEFR) (Council of Europe 2020), which distinguishes between societal multilingualism, where multiple languages coexist within the society, and individual plurilingualism, where multiple languages are integrated. Mouti (2024) defines plurilingual competence as 'the ability to communicate in three or more languages' and includes translanguaging, codeswitching, language mediation, and transfer. Plurilingual competence or repertoire of languages refers to all individuals being potentially plurilingual' (497). Plurilingual competences vary among individuals because their linguistic profiles are uneven and dependent on the individual's needs and experiences (Piccardo and North 2020). Martín-Peris, López-Ferrero, and Bach (2018) argue that there is a connection between plurilingual competence and discourse competence because the development of discourse competence requires meta-awareness and understanding of discourse structures beyond a single linguistic system. Although plurilingual competence descriptors guide broader educational policies and curricula, their implementation in assessment practices has been limited, due to both assessment constraints and traditional language ideologies (Lopez, Turkan, and Guzman-Orth 2017). For that reason, many tests designed on multilingual premises still draw on traditional multilingual standards, where languages are viewed and assessed side by side.

All nine sources call for fundamental changes in language and content testing and assessment to move away from the prevalent monolingual approaches. In terms of language assessment,

Chalhoub-Deville (2019) suggests an alternative assessment paradigm where multilingual approaches represent a disruptive, rather than sustaining, innovation. Although sustaining innovation brings novelty to established practices, it is insufficient to create change. Therefore, disruptive innovations are necessary to perform essential changes to the core understanding of the communicative competence construct and current assessment practices. To implement disruptive innovation, she proposes transformative approaches to existing models of construct representation. Such transformation would entail adopting an additive outlook on multilingual competence, where languages are integrated in a plurilinguistic system, which reflects real-world communicative settings. These settings require heteroglossic acquisition and translanguaging, in contrast to interlanguage development and code switching. Chalhoub-Deville refers to Schissel et al.'s (2018) study, where they present an implementation of a multilingual task-based assessment, as an example of a disruptive innovation in language assessment.

Self-assessment has been widely used to show the integrated plurilinguistic repertoire of individuals. Self-assessment practices have been promoted by the Council of Europe and CEFR (Council of Europe 2020) using language portfolios and language body maps, the purpose of which is to raise awareness about the plurilingual repertoire (Gorter and Cenoz 2017; Mouti 2024). Given that the validity of self-assessment has not been established, Bot, Paradis, and Schwieter (2019) identify dynamic assessment as a more appropriate multilingual assessment method. Because dynamic assessment focuses on what test takers can or cannot do in interactions with different levels of scaffolding, this type of alternative assessment allows for calibration of test takers' learning potential, which can be useful in planning teaching interventions or support.

When it comes to assessment of content, particularly in integration with language, heteroglossic assessment that includes language choice, translanguaging, code-switching, and code-mixing makes sense. Heteroglossic assessments can be put on a continuum, where on one end languages are viewed as separate, isolated systems and on the other as homogenous and integrated. Shohamy (2011) provides two different examples of how multilingual assessments could be implemented to measure students' content knowledge and competences. In one example, she suggests that one language could be used for input and another for output; for instance, the students read a text in one language, for example the students' L1 (Gorter and Cenoz 2017; Shohamy 2011) and are expected to summarize it in oral or written form in another. Such tasks would legitimize using multiple languages to perform a task only if the rating scale does not rely on monolingual criteria, which tend to penalize test takers for language transfer and interference. In the other example, Shohamy (2011) proposes implementing tasks in which the same input is provided in two languages. Although such tasks may seemingly involve the two languages as two isolated parallel systems, the article argues that Shohamy's previous research suggests that students apply bilingual strategies to think and respond to the tasks, thus exhibiting cognitive language integration rather than separation.

Some of the sources argue that application of multilingual tasks is not sufficient to implement a valid multilingual assessment approach – application of a multilingual scoring method is essential (Gorter and Cenoz 2017; Shohamy 2011). Shohamy (2011) warns that monolingual scoring methods disadvantage test takers' multilingual strategies in their task solution process. Gorter and Cenoz (2017) provide an example of how multilingual written performances can be scored for each language used individually and then using a bilingualism or a multilingualism index, which combines the scores of two or more languages. They call for legitimization of translanguaging by allowing students to use multiple languages in an assessment situation that reflects actual translingual communicative settings. As examples of a translingual assessment approach, they cite Sierens and Avermaet's (2014) 'functional multilingual learning,' which offers the potential to raise multilingual awareness, and Escamilla et al.'s (2013) 'literacy squared writing rubric,' which promotes a translingual scoring approach.

Although the sources call for a paradigm shift from monolingual to multilingual assessment, they also acknowledge challenges in its implementation and interpretation (Lopez, Turkan, and

Guzman-Orth 2017). Given that the construct of multilingual communicative competence is complex, dynamic, fluid, and context-dependent, its definition, description, and operationalization through assessment tasks and scoring systems represents a difficult feat.

RQ 3: How is students' multilingual competence measured or operationalized?

Theories and models of multilingual communicative competence provide the foundation for design of assessment tools. However, the theoretical models need to be operationalized to be implemented in assessment practice. To understand how the constructs are operationalized, we included studies that present analyses of student performance and characteristics of task design in multilingual assessment.

Eight empirical studies contribute to an understanding of how multilingual assessment of content and language can be designed and implemented by exploring student performance on different types of assessment. Most of the studies explore multilingual assessment of content in contexts characterized as bilingual (Archila et al. 2022; Mazak, Rivera, and Soto 2016), EMI (Gülle and Bayyurt 2024) or CLIL (Jiang, Li, and Leung 2024; Leontjev and deBoer, 2022), while one study focuses on multilingual assessment within the context of a language course (Wang and East 2024). One recently edited volume (Vogt and Antia 2024) offers perspectives on multilingual assessment of content and language across educational contexts in the Global South and Global North.

In terms of theoretical framing, most of the studies draw on newer constructs of multilingualism, especially translanguaging. As translanguaging in relation to assessment is underexplored in the literature, notably as pertains to writing where a monolingual ideology reigns strong, several studies explore the space available for and occupied by translanguaging practices in written exams and course work in preparation for these exams. Mazak, Rivera, and Soto (2016), for example, examine the translanguaging practices used by students in written exams in a bilingual English-Spanish content course at a Puerto Rican university. In the three parallel sections of this course, students chose by vote the medium of instruction (Spanish, English, or both), while the written exam questions were phrased in both Spanish and English and students could answer them using English, Spanish, or both. Meanwhile, in the context of EMI programs in a Turkish context characterized by English-only policies, Gülle and Bayyurt (2024) explore the viability of translanguaging in assessment of written exams against the backdrop of studies pointing to the need for linguistic accommodation and flexible language use in assessment. Although the affordances for translanguaging assessment are markedly different across these two contexts, one central argument forwarded in both studies, and supported both by how the students perform on and perceive written exams, is that the use of multilingual assessment allows some students to overcome challenges in accessing, understanding and displaying content knowledge.

This rationale for multilingual assessment also comes out in studies exploring assessment processes and outcomes in higher education contexts characterized by a visible gap between de jure and de facto policies of multilingualism (Vogt and Antia 2024). An example of this is the study Nkoala (2024), which examines how journalism students at a South African university use multilingualism in a context where the indigenous languages these students speak at home carry little educational value and thus do not afford the 'epistemic access' instated in macro-level policy documents. Drawing on the notion of language-as-a-resource (Ruiz 1984) combined with Grosjean's (1997) complimentary principle, Nkoala presents a monolingual-multilingual continuum that captures how the journalism students used their linguistic repertoire in different 'modes of assessment' represented in the program. The application of this continuum to an analysis of students' uses of different languages in assessment processes and products showed that monolingual English was activated most in traditional and summative written assessment relying on academic sources (e.g. academic essays), whereas multilingualism, relying on English and indigenous languages, was activated most in audiovisual assessments incorporating non-academic sources (e.g. podcasts or with interviews with community members). The results of this study point to the need to factor in different types of assessment as students use their linguistic resources differently in different modes as

well as to consider the processes underlying the assessment product/outcome; factoring in assessment processes, as also argued in several other of the studies, yields deeper insights into student performance than when only the product/outcome is assessed (Mazak, Rivera, and Soto 2016), not least as concerns content and language integrated learning (Leontjev and DeBoer 2022).

Though most of the studies reviewed focus on translanguaging assessment as involving multiple languages, a few studies extend the scope of this construct to include multimodality (Wang and East 2023; Jiang, Li, and Leung 2024). In the context of a Chinese language course for beginning learners in New Zealand, Wang and East (2023) explore how students perform on and perceive a new test design integrating digital multimodal composition (DMC) and translanguaging, replacing a monolingual handwritten test. Similarly, Jiang, Li, and Leung (2024) explore innovative uses of DMC as translanguaging assessment in CLIL classrooms in Japan, focusing on how the teachers enacted this type of assessment. While these studies point to affordances of DMC in both contexts, including augmented test/task performance (Wang and East 2023) and more accurate, timely and longitudinal evidence of learning (Jiang, Li, and Leung 2024), they also point to challenges.

Moreover, while making the multilingual construct concrete is important in knowing students' linguistic behaviors and content knowledge display, how the assessment task is designed is also crucial in making inferences about students' abilities. This information affects the decisions stakeholders make because of students' performance, which is why assessors must consider consequential validity in designing assessment tasks and justifying their use. Seven studies in our review provide examples of multilingual assessment tasks that take consequential validity into account, ensuring that assessment outcomes adequately represent test takers' abilities, especially when these outcomes are used as a basis for decisions such as granting tenure to professors based on their linguistic abilities (Baker and Hope 2019), or whether students are learning from and pass their content subjects (Rafi 2023; Jiang, Li, and Leung 2024), and foreign language courses (Wang and East 2023; Mouti 2024; Bleichenbacher et al. 2024). Four of the studies are focused on assessing and self-assessing (multilingual) language proficiency and writing ability (Wang and East 2023; Baker and Hope 2019; Mouti 2024; Bleichenbacher et al. 2023; Meletiadou, in Antia and Vogt 2024), while one mostly assesses content (Jiang, Li, and Leung 2024), and one assesses a combination of content and language (Rafi 2023).

The volume on multilingual assessment edited by Vogt and Antia (2024) includes one chapter that focuses on different tasks on multilingual assessment. The chapter by Meletiadou explores the potential of multilingualism in assessing students' comprehension and writing performance in the British university context. She employed different methods, including classroom observations, focus group discussions, students' pre – and post-tests, and learning journals to investigate the impact of using translanguaging in the following tasks: brainstorming, discussing task instructions, exchanging ideas, writing a short essay on the topic focusing on fluency, and exchanging oral feedback using English. Her findings show students had a very positive reaction towards the task and improved their academic performance.

The included articles showcase a variety of task types, depending on the multilingual component they are trying to assess. Most of the empirical studies assess students' writing ability, both in content classes such as English literature (Rafi 2023), science communication classes, and liberal arts classes (Jiang, Li, and Leung 2024), while evaluating students' writing abilities is also a focus in Chinese language classes (Wang and East 2023). These studies expand on the traditional understanding of writing as a textual practice, arguing that assessing students' multilingual writing abilities should also include multimodal elements to have a more expansive understanding of their abilities. Thus, the authors, most notably Jiang, Li, and Leung (2024) argue that digital multimodal composing must be a key part of the assessment tasks, where students create their compositions digitally and make use not only of multiple languages, but also multiple modes such as audio, video, and images.

For example, Wang and East's (2023) study explores how 163 beginners studying Mandarin Chinese perform on an online writing test that incorporates a translanguaging task, where they had to

introduce their family to an imagined audience. They found that students demonstrated purposeful translanguaging in their work and still managed to complete the task within the time limit. Their results also show that augmented task completion occurs when learners' trans-semiotic repertoires were recognized as a way of expressing their identities.

Similarly, Rafi's (2023) research, situated in Bangladesh, reports on a translingual assessment task he designed that aligned with the language and content learning objectives of writing skill development and English poetry university classes. His intervention allowed 17 students to draw upon their multilingual, multicultural, and personal contexts and capabilities to answer written tasks. In particular, he incorporated multilingual vocabulary induction, translation, guided reading through authentic Bangla texts, and included familiar cultural examples (as opposed to Western texts) to assess students' understanding of paragraph organization. For assessing students' understanding of content classes in English poetry focusing on the metaphysical features of John Donne's poem 'The Sunne Rising,' Rafi implemented cross-linguistic analysis, translation, translingual writing, and a YouTube video of a Bangla pop song to scaffold students' understanding. He observed that students, instead of merely memorizing literary terminology or relying on Internet materials, utilized their metalinguistic, metacognitive, and multicultural abilities to process their ideas and answer the tasks. He found that students became more critical and could better process the concepts in the writing tasks.

Jiang, Li, and Leung (2024)'s action research is notable for focusing on using digital multimodal composing as translanguaging assessment, where they integrate both multimodality and multilingualism in classroom assessment, combining linguistic means of representation with other modes for knowledge display using digital technologies. The study discusses situated examples of DMC translingual assessments, focusing on teachers' experiences when implementing such assessments. Examples in the study include a historical video documentary on street food in Hong Kong, and a scientific video documentary about the issues regarding Hong Kong's fishpond aquaculture practices. According to the researchers, DMC as translanguaging assessments were able to produce richer evidence of students' content learning because of the wider range of representational languages and modes that students can draw on.

Notably, in terms of assessing listening, one study shows an attempt to create a translingual French/English listening task for professors in a bilingual Canadian university (Baker and Hope 2019). The authors aimed to represent the target language use domain more authentically, which has professors regularly translanguaging, so they piloted a listening task based on a translingual department meeting. It is a unique contribution of this study that it uses a translingual meeting to evaluate listening instead of separating the languages to be evaluated into English and French, reflecting authentic contexts experienced by professors in the university.

Two studies, meanwhile, also highlighted the importance of self-assessment of plurilingual abilities. Mouti (2024) and Bleichenbacher et al. (2023) study how future language teachers assess their own plurilingual competence through a variety of tasks (e.g. language passports, language portraits, DIALANG diagnostic tests, written narratives, short surveys), arguing that an awareness of one's own plurilingual competence is an important skill for future language teachers to develop. It is notable that these studies, when applying plurilingualism in their assessment designs, treat languages as separate entities and do not explicitly encourage translanguaging or code-switching.

A key commonality in four of these assessment tasks (Wang and East 2023; Rafi 2023; Baker and Hope 2019; Jiang, Li, and Leung 2024) was the explicit instruction to translanguage, i.e. allowing students to choose and use languages they knew other than the target language to answer the task and facilitate communication. Two of the studies (Wang and East 2023; Rafi 2023) pay particular attention to how translanguaging allows students to engage with 'messy creativity' (Li 2020) or using another language or mode to expand their linguistic repertoires without being focused on producing the correct output.

Another similarity is that majority of the studies take an action-research approach in designing their assessments (Rafi 2024; Jiang, Li, and Leung 2024) or report on the task in the early stages of its

trialing (Wang and East 2023; Baker and Hope 2019). Although they discuss the challenges of developing these tasks in terms of other types of validity, stakeholder perceptions, and the prevalence of English and/or monolingual ideologies in their context, they still emphasize the value of these innovative tasks and encourage teachers to explore these in their own contexts.

RQ 4: What are the key findings of previous studies on the advantages and disadvantages of multilingual assessment methods? What are stakeholders' perspectives on multilingual assessment?

As mentioned in the previous sections, a large portion of the conceptual and the empirical papers in this scoping review examined and discussed the advantages and disadvantages (32%) of multilingual assessment and stakeholder perspectives (29%).

Advantages and disadvantages of multilingual assessment

The studies reviewed include 11 items that provide insights into the advantages and disadvantages of multilingual assessment. The most common advantage to translanguaging is that it promotes inclusivity by challenging monolingual ideologies and aligning assessments with real-world multilingual practices (Adhikari and Poudel 2024; Heugh, Li, and Song 2017; Shohamy 2011). Similarly, it empowers students by liberating them from monolingual constraints and prioritizing content understanding over language proficiency (Mbirimi-Hungwe 2021; Mazak, Rivera, and Soto 2016). According to the texts, multilingual assessment enhances learning and engagement, as it improves writing quality, supports holistic development, and increases student participation (Chen, Tsai, and Tsou 2019; Cumming 2013; Morales, Schissel, and López-Gopar 2020). Additionally, it allows students to draw on their L1s to support high-level academic proficiency. According to the material, this provides a more accurate assessment of their knowledge (Gülle and Bayyurt 2024; Heugh, Li, and Song 2017; Mazak, Rivera, and Soto 2016).

However, the included material notes some disadvantages to multilingual assessment. To begin with, implementing valid and reliable translanguaging assessments and standardizing practices across different contexts can be challenging (Adhikari and Poudel 2024; Morales, Schissel, and López-Gopar 2020). Among the noted challenges is that the process requires significant resources and extensive training for educators (Cumming 2013; Heugh, Li, and Song 2017; Mbirimi-Hungwe 2021). This is notable considering circumstances when teachers have a diverse set of students with many languages, and it may not be practical or possible to accommodate all the students' languages and the teacher may not be proficient or fluent in some of the students' languages. Moreover, evaluating multilingual writing (with allowance for translanguaging) can be complex and time-consuming, potentially leading to inconsistencies (Chen, Tsai, and Tsou 2019; Gülle and Bayyurt 2024; Mazak, Rivera, and Soto 2016). Additionally, there may be resistance from traditionalists and biases towards certain languages, which can affect the fairness of assessments (Adhikari and Poudel 2024; Shohamy 2011; Mazak, Rivera, and Soto 2016).

Stakeholder perceptions of multilingual assessment

To investigate educational innovation, data from qualitative interviews and open-ended questionnaires are used to track key stakeholders' attitudes and perceptions about implementing new systems (Jacobs 2020). The seven sources focused on participant perceptions of innovative pedagogic and assessment methods in multilingual contexts include quantitative and qualitative data from students and teachers to review formative pedagogical development and assessment during and after implementing new language and content initiatives. This methodology is applied across various educational contexts including language (EFL) and content courses.

Regardless of the educational aims, the included perception data suggests that translanguaging in EFL and multilingual assessment helps to better understand and learn materials and build language awareness (Bleichenbacher et al. 2023). Students report that they feel more comfortable and

confident when they can use their native language alongside the target language, which they report leads to increased student engagement. Lastly, and perhaps one of the strongest elements drawn from perception research is that these assessments are perceived as fairer and more inclusive, accommodating diverse linguistic backgrounds (Antia, Weldemichael, and Dyers 2021; Baker and Hope 2019). This research has also provided insights into challenges associated with learners' beliefs about language learning and monolingual norms.

Perception studies focus on inclusivity and diversity related to translanguaging and multilingual options in assessment for students were presented to advocate for changes in language policy in Nepal and South Africa, where English has dominated as the medium of instruction, to the apparent detriment of local languages (Adhikari and Poudel 2024; Antia, Weldemichael, and Dyers 2021). In Nepal, where EMI is predominant in higher education, Adhikari and Poudel (2024) draw on interview responses by teacher educators to graduate student written exams that included translanguaging. The interviews highlighted four reasons for students' use of translanguaging: mixed-medium instruction in classes, inadequate mastery of the chosen media of instruction languages, lack of academic content in Nepali, and the perceived inadequacy of Nepali to fully express academic content. Similarly, in South Africa, the researchers argue for inclusion of the use of multilingual repertoire for assessment drawing on students' reflections on how multilingual instructions and questions influenced their feelings and comprehension. The students also considered how writing answers in one or a combination of three languages affected their performance in the mid-term test and any other impacts they experienced. Overall, the students note positive emotions related to their assessment experience that allow for explanation and production in their native language(s). Antia et al.'s (2021) findings show concerns that run from the cognitive to the emotional, and 'underscores the conditions under which students have to succeed in assessment tasks, given the disarticulation between the institution's dominant use of English and the students' own linguistic profile' (63).

Documenting this emotional reaction by students to translanguaging in foreign language classrooms has been used to evaluate and revise innovative assessment practices. Though the studies report positive response to options for multilingual demonstration of language and content, students have also reacted with skepticism (Mena-Orduña, Cots, and Llanes 2024; Wang and East 2024). When given opportunities for inclusion of English to support Chinese L2 writing under assessment, students learning Chinese as a foreign language reported task enjoyment and appropriate use of translanguaging, particularly for low level learners. The learners found the approach novel and reported lower temptation to 'cheat' via technology when given the chance to support their responses through translanguaging. However, students also reported less-positive emotions and feelings of discomfort when allowed to translanguage, noting that this type of performance on a test challenged their identities as target language learners and those target language norms (Wang and East 2024). Researchers in Spain report similar results from EMI and EAP students. Analyses of Spanish L1 students' discourse in English during a speaking assessment where they could use all their communicative resources revealed a spectrum of opinions on the legitimacy of using their entire plurilingual repertoire, rather than clear-cut positions. Additionally, the results highlighted a prevalent monolingual mindset among learners, causing them to resist translanguaging either implicitly or explicitly (Mena-Orduña, Cots, and Llanes 2024).

Discussion

The current review explored the conceptualizations (theoretical models), operationalizations (empirical approaches), and stakeholder perspectives in relation to multilingual assessment in internationalized higher education. Despite the popularity of research that analyzes the frequency and the characteristics of multilingual communication in internationalized university contexts, especially in the form of translanguaging, multilingual assessment has not received the same level of attention. Implications and recommendations strongly maintain the focus on multilingual

and translingual pedagogy, while assessment tends to be mentioned only in passing. Therefore, it was important to consolidate and synthesize existing theoretical discussions, as well as empirical approaches, conceptualizations, and findings in order to create a strong foundation for future research endeavors in the multilingual assessment domain.

The analysis of the bibliographic characteristics of the included studies suggests that very few focus on large-scale multilingual assessment or assessment instrument validation. Instead, they mostly focus on the feasibility of conducting multilingual assessments and perceptions of advantages and disadvantages in local or classroom assessment contexts. These publications are scattered across different journals that are not only associated with language but also content, which means that these articles have different audiences and various foci. This highlights the fragmented nature of the research and the need to have a more coherent and explicit focus on multilingual assessment among these studies.

During the scoping review, we found that a stronger emphasis on multilingual assessment rests on testing and assessment practices in lower educational levels, i.e. elementary and secondary education, especially in relation to integrating content and language. Hence, many of these sources had to be excluded as they lacked applicability to assessment in higher education. The conceptual papers we have included draw on theoretical discussions related to these lower educational levels with the intention of establishing their relevance to higher education. Although assessment in higher education overall lacks emphasis, theoretical conceptualizations and research findings from elementary and secondary education could be used as a springboard for theorization of multilingual assessment in higher education. Most research on multilingual assessment occurs in EMI contexts despite expectations that it would be more widespread in other contexts. While we did not include 'EMI' as a search term, the prominence of EMI contexts in the literature on multilingual assessment in higher education came out of majority of the studies included in our review.

One of the most noteworthy findings is the variability in multilingual assessment approaches, which according to Shohamy (2011) could be placed on a continuum from use of several languages, making accommodations, and combining competences to legitimization of the cognitive and the social advantages of translanguaging (Melo-Pfeifer and Ollivier 2023). Among the reviewed sources, translanguaging is the most prevalent theory that informs current attempts and future recommendations in multilingual assessment. The emphasis on translanguaging suggests that the holistic perspective on students' communicative repertoires in which diverse linguistic and semiotic resources are integrated remains preferred in current conceptualizations of multilingualism.

Another finding is that many studies on multilingual assessment focus on assessing language proficiency or writing ability in one or more languages using translanguaging, and less so on content. This underscores the need for more research to be conducted on CLIL or similar content-based contexts to further validate the often-cited advantage that multilingual assessment allows students to better display their knowledge of content. This would also allow assessment to be more aligned with the goals of content classes.

Additionally, the included studies consider multilingual assessment as assessing language proficiency in more than one language separately. This reveals that despite the promotion or explicit pronouncement of multilingualism, a parallel language paradigm or monolingual ideology is still dominant in these assessments. While there have been calls for language specialists to assess languages in an integrated manner, this has been developed more theoretically than in practice, as is seen in the reviewed studies.

When it comes to the assessment scope, most studies implemented multilingual assessments that are mostly formative, classroom-based, and limited to the local higher education context. There is a dearth of publications on large-scale multilingual assessments in higher education; as previously mentioned, much large-scale research on multilingual assessment has been conducted in primary and secondary contexts, owing to the visibility and prevalence of multilingual pedagogies in classrooms with younger students. The potential of dynamic assessment has been underexplored in the

studies: while Bot, Paradis, and Schwieter (2019) cite its potential in assessing multilingualism, no studies in our review have implemented it.

Given that multilingual assessment is not yet a widespread practice, most reviewed studies include stakeholder perspectives and highlight its benefits and challenges. While the literature points out the assessment constraints, such as lack of clear constructs, resources, and teacher expertise are highlighted, it also foregrounds stakeholder's positive perceptions of multilingual assessment affordances, especially equity and inclusion.

Finally, because we found that almost all studies were conducted in multilingual contexts where English is an additional language, much of multilingual research is focused on English and the local language, not other languages that may also be used in a particular multilingual context. Thus, we recommend more studies on other multilingual contexts apart from English be conducted, so that a broader representation of multilingual assessment may be achieved.

Conclusion

This scoping review identified 28 articles published between 2011–2024 that present conceptual and empirical research on multilingual assessment in internationalized higher education. Thus, this review confirms the observation of many scholars that multilingual assessment is (still) under-researched. Nonetheless, the majority of the articles (16 out of 28) being published in 2020 onwards shows that there is a growing interest in multilingual assessment in the last five years.

The review provides an overview of research on multilingual assessment in higher education, highlighting theoretical models of multilingualism, the types and tasks commonly implemented in multilingual assessment, students' performance in these types of assessments, the (dis)advantages of multilingual assessment, and stakeholder perceptions. In discussing these, we have also found some important gaps in the literature and implications that we recommend future researchers explore.

As many of the studies we found focused on language assessment, more research on multilingual assessment in content classes in higher education needs to be conducted. This will further validate the often-cited advantage that multilingual assessment allows students to better display their knowledge of content. Moreover, more research on multilingual assessment should be conducted in contexts where English is not one of the languages focused on, so that a broader representation of the languages involved in multilingual assessment may be achieved. In relation to stakeholder perspectives, other stakeholders' (apart from teachers and students) perceptions of multilingual assessment need attention, since language policy and attitudes in broader society often influences what is implemented in universities. Our understanding of multilingual assessment can further improve if large-scale and quantitative approaches are also implemented in assessment practices and research, Greater attention still needs to be paid to multilingual assessment in higher education, as translingual and multimodal approaches to assessment continue to become more valid and implemented, and especially in the age of generative AI and the growth of translation software and applications. Our review has implications not only for future research on multilingual assessment, but also for teachers who are interested in exploring how they can implement this and for stakeholders looking to understand the importance of multilingual assessment in higher education.

While this scoping review offers important insights regarding current issues and trends in multilingual assessment in higher education, it also has some limitations. The studies selected were limited to the search terms used, the most relevant databases, and were only limited to texts that were published in English, because this was the common language of all the researchers, and most peer-reviewed articles tend to be published in English. Additionally, the last search conducted was in December 2024. Therefore, some potential articles may have been overlooked. Despite this, we recommend that future researchers utilize more languages in their search for articles on multilingual assessment, especially in contexts where multilingual assessment is more widely researched and practiced.

Appendix

First Author and Year	Country	Setting	Type of source	Type of publication	Study design	Approach to multilingual assessment	Focus	Assessment scope	Themes
Adhikari 2024	Nepal	Higher education	empirical research	article	interview-based	translanguaging	content	classroom	perceptions (teacher & student); (dis)advantages of multiling. assessment
Antia 2021	South Africa	Higher education	empirical research	article	classroom-based; Other: phenomenological methodology	translanguaging multilingualism	language	other	perceptions (teacher & student)
Archila 2024	Colombia	Higher education	empirical research	article	survey; classroom-based;	multilingualism	content language	formative	construct based on description of performances
Baker 2019	Canada	Higher education	empirical research	article	survey; observational; Other: test validation	translanguaging	language	other	perceptions (teacher & student); tasks
Batyi 2016	South Africa	Higher education	empirical research	article	Other: pedagogical intervention (online)				
Bleichenbacher 2023	Switzerland	Adult education	empirical research	chapter in an edited volume	survey; classroom-based	plurilingualism	language	-self-assessment	perceptions (teacher & student); tasks
Chalhoub-Deville 2019	N/A	Other:	conceptual	article	Other	multilingualism	language	other	theoretical description of construct
Chen 2019	Taiwan	Higher education	empirical research	article	classroom-based; Other: comparing translanguaging use of high and low scorers	translanguaging	language	classroom	construct based on description of performances; (dis)advantages of multiling. assessment
Cumming 2013	Canada	Other: higher & community high school	empirical research	article	Other: text-analysis	multilingualism	language	other	theoretical description of construct; (dis)advantages of multilingual assessment
Gorter 2017	Spain, USA, and Canada	Other:	conceptual	article	Other	multilingualism	language	other	theoretical description of construct
Gülle 2024	Turkey	Higher education	empirical research	article	interview-based; classroom-based	translanguaging	content	summative	construct based on description of performances; perceptions (teacher & student); (dis)advantages of multilingual assessment
Heugh 2017	Australia	Higher education	empirical research	chapter in an edited volume	action research; Other: micro-study	translanguaging	language	classroom	construct based on description of performances; (dis)advantages of multiling. assessment
Jiang 2024	Hong Kong	Other: both secondary and higher education	empirical research	article	action research	translanguaging	content language	classroom	construct based on description of performances; tasks
Leontjev 2022	Japan	Higher education	empirical research	article	observational; classroom-based	multilingualism	content	formative	construct based on description of performances
